**TRAFFIC STUDY FOR
THE PLATINUM TRIANGLE MASTER LAND USE PLAN EIR**

Prepared by:

Parsons Brinckerhoff Quade & Douglas, Inc.

Prepared for:

City of Anaheim

April 5, 2005

1.0 INTRODUCTION

This report presents the traffic impact analysis associated with the following actions (herein after referred to as the “proposed project”) associated with The Platinum Triangle Master Land Use Plan:

- Implementation of the adopted Platinum Triangle Master Land Use Plan, the Platinum Triangle Mixed Use (PTMU) Overlay Zone, The Platinum Triangle Standardized Development Agreement and the Updated and Modified Mitigation Monitoring Program No. 106 for The Platinum Triangle. Implementation is intended to include, but not be limited to, the approval of subdivision maps, grading permits, street improvement plans, final site plans, development agreements and other related actions for properties located within The Platinum Triangle.
- General Plan Amendment No. 2004-00420 – A request to amend the City of Anaheim General Plan Land Use Element to redesignate a 3.21-acre property located at 2400 E. Orangewood Avenue (“Fire Training Site”) from the Office-High to the Mixed-Use land use designation. The General Plan is also proposed to be amended to provide for an additional 325 dwelling units and up to 210,100 square feet of additional commercial square footage in The Platinum Triangle Mixed-Use land use designation.
- Zoning Reclassification No. 2004-00134 – A request to reclassify the Fire Training Site from the PR (Public Recreational) Zone to the PR (PTMU) (Public Recreation - Platinum Triangle Mixed Use Overlay) Zone.
- Zoning Code Amendment No. 2004-00036 and an amendment to The Platinum Triangle Master Land Use Plan (Miscellaneous Case No. 2004-00089) – A request to amend the PTMU Overlay Zone and the Master Land Use Plan to adjust the boundaries of the mixed-use districts to include the Fire Training Site in the PTMU Overlay Zone Gateway District and add 325 units to said district (321 of said units would be designated for the Fire Training Site). The amendment to the Overlay Zone and the Master Land Use Plan would also include modifying the PTMU Overlay Zone commercial density to add 210,100 square feet of additional commercial square footage. Of this square footage, 190,100 square feet would be designated for future required ground floor commercial uses on Market Street and Gene Autry Way in the Katella and Gene Autry Districts and 20,000 square feet for other commercial uses in the Katella District. In conjunction with these amendments, additional technical refinements and clarifications are also proposed to the Master Land Use Plan and Overlay Zone, including, but not limited to refinements to street cross-sections and density descriptions to reflect the above-noted changes and other City Code requirements.

In this traffic study, four different scenarios were analyzed. They are as follows:

-
1. Existing Conditions
 2. Buildout of the adopted Platinum Triangle Master Land Use Plan (“Adopted MLUP”) with Existing Lane Geometrics
 3. Buildout of The Platinum Triangle Master Land Use Plan in accordance with the proposed project (“Proposed MLUP”) with Existing Lane Geometrics
 4. Buildout of The Platinum Triangle Master Land Use Plan in accordance with the proposed project (“Proposed MLUP”) with Planned Circulation Improvements

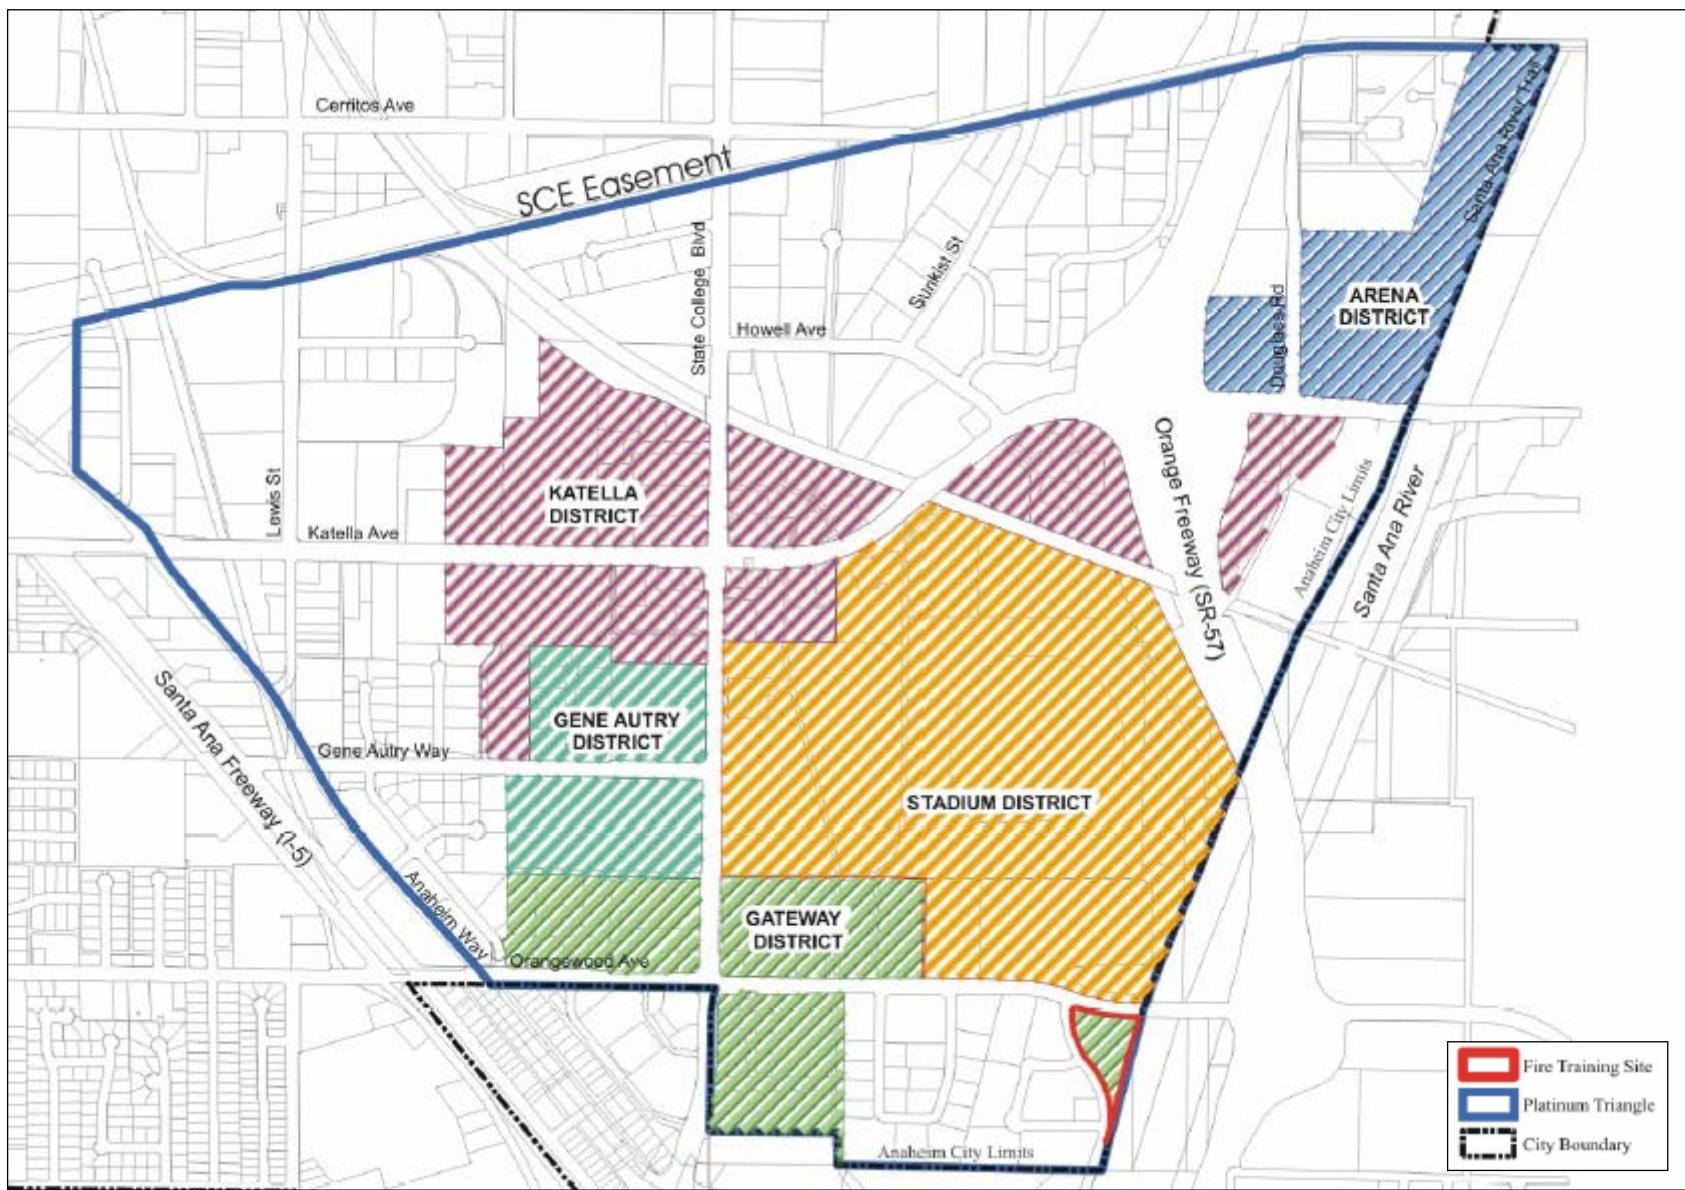

The Adopted MLUP represents build out of The Platinum Triangle in accordance with the land use intensities indicated in the General Plan. Proposed MLUP represents build out of The Platinum Triangle in accordance with the proposed project. Existing Lane Geometrics represents those street improvements currently in place as of March 2005. Planned Circulation Improvements represents those street improvements as indicated by the General Plan, The Platinum Triangle Master Land Use Plan and associated documents.

2.0 METHODOLOGY

The methodology adopted for this study involved the application of the Anaheim Traffic Analysis Model (ATAM) to forecast AM and PM peak hour traffic at the intersections in The Platinum Triangle with full build out of The Platinum Triangle MLUP. ATAM is the traffic forecasting modeling tool for the City of Anaheim, and has been found consistent with the Orange County Transportation Analysis Model (OCTAM) developed by the Orange County Transportation Authority.

For modeling purposes, the General Plan land use assumptions in The Platinum Triangle were reviewed and updated to be consistent with site plan proposals currently under review by the City and expectations about the geographic distribution of development within each district. City staff provided direction on the appropriate allocation of future development in each of the model’s traffic analysis zones (TAZ). The Adopted MLUP scenario reflects the General Plan level of development including this reallocation of land use among TAZs in each district. Figure 2.1 presents The Platinum Triangle Districts identifying the boundaries of Adopted MLUP.

Figure 2.1: The Platinum Triangle Districts

Source: City of Anaheim

City staff also provided land use allocation by TAZ for the proposed additional residential and commercial development. For each future land use scenario, mixed use trip reduction was calculated for each district in The Platinum Triangle using the Institute of Transportation Engineers methodology. The amount of residential, commercial, and office development in each district determined the percentage reduction of trips. Because the Fire Training Site is spatially separate from the rest of the Gateway District, the mixed use trip reduction was calculated separately for that site.

Table 2.1 presents the percent internal capture computed for Adopted MLUP and Proposed MLUP by each district.

Table 2.1: Mixed-Use Trip Reduction Plan by District

Platinum Triangle Districts	Percent Internal Capture for Adopted MLUP	Percent Internal Capture for Proposed MLUP
Katella District	15.2 %	16.5%
Gene Autry District	9.0%	17.9%
Gateway District	5.9%	5.5%
Stadium District	13.9%	13.9%
Arena District	19.9%	19.9%
Fire Training Site	NA	4.5%

NA – Not Applicable

The future traffic forecasts were used to estimate future levels of service (LOS) during morning and afternoon peak hours at 29 study intersections in the area – 24 intersections in Anaheim and five in the City of Orange (identified by the City of Orange for inclusion in this traffic analysis pursuant to a letter submitted to City of Anaheim dated February 8, 2005). The Proposed MLUP LOS results were compared with the LOS results from the Adopted MLUP to identify significant adverse impacts of the Proposed MLUP and to identify future lane requirements at the study intersections in the City of Anaheim to achieve a peak hour LOS “D” at intersections, in accordance with the City’s adopted LOS standard.

The threshold of significance for traffic impacts is a peak hour LOS worse than “D” with an increase in the Intersection Capacity Utilization ratio of at least 0.02. When the Proposed MLUP condition is compared with the Adopted MLUP, mitigation will be required for any intersection which increases the peak hour ICU by at least 0.02 and is projected to operate at LOS E or F.

3.0 EXISTING CONDITIONS

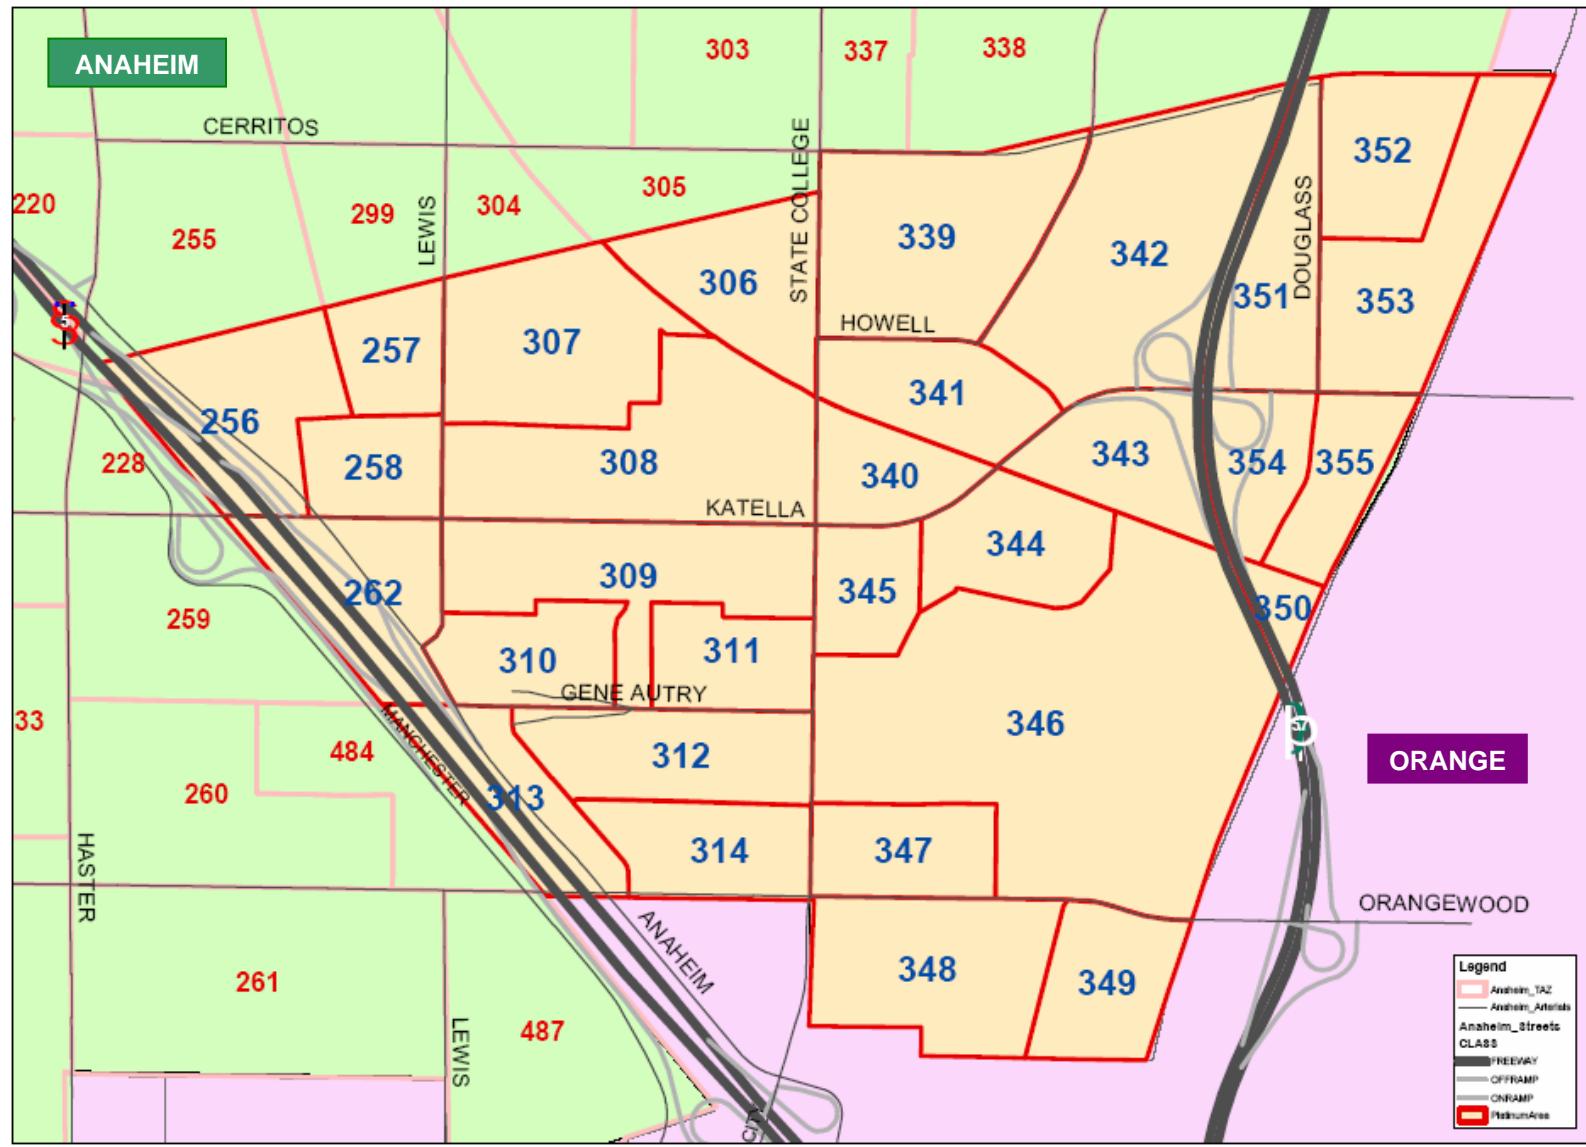

For traffic modeling purposes, development is quantified by land use category in traffic analysis zones (TAZ) throughout the City. Figure 3.1 shows the TAZ numbers and boundaries for The Platinum Triangle. Table 3.1 quantifies the existing land use in The Platinum Triangle by TAZ. In addition to Angel Stadium of Anaheim and Arrowhead Pond of Anaheim, existing land use is largely industrial in nature, with no residential development. There are currently zero dwelling units in the area, approximately 3,827 thousand square feet (TSF) of industrial development, 203 TSF of commercial development, and 1,558 TSF of office space.

The existing mid-block number of lanes on the streets in The Platinum Triangle is shown in Figure 3.2, and the existing intersection lane geometry is summarized in Table 3.2.

Existing daily trip generation in the project area is summarized in Table 3.3. Currently, development in the project area generates a total of approximately 95,000 daily trips.

Existing average daily traffic volumes on the streets in The Platinum Triangle are shown in Figure 3.3. Peak traffic conditions are evaluated based on the peak hour levels of service at the study intersections. Existing LOS at the study intersections is summarized in Table 3.4, and the ICU calculation worksheets are included in Appendix A. Currently, most of the intersections operate at an acceptable LOS in both the peak hours. The only exception is intersection of Santiago Boulevard and Meats Avenue located in the City of Orange, which operates at LOS E in the morning peak hour.

4.0 ADOPTED MLUP

This scenario represents buildout of the City's General Plan, including planned land uses within The Platinum Triangle. Planned land uses within each TAZ in the area are summarized in Table 4.1. The long-range vision for this area includes a major transition from industrial uses to mixed-use residential, commercial, and office development. The General Plan includes mixed use development in The Platinum Triangle comprising a total of 9,175 dwelling units, 2,044 TSF of commercial development, and 3,265 TSF of office.

For this scenario, the existing lane configurations were used to analyze the impact of adopted General Plan land use traffic; so the assumed lane configurations at each of the study intersections are the same as summarized in Table 3.2.

Projected future daily trip generation in the study area for the Adopted MLUP is summarized in Table 4.2. Adopted MLUP development intensity in the study area is projected to generate a total of approximately 260,000 daily trips, 173.6 percent more than existing development.

Projected daily traffic volumes on the streets in The Platinum Triangle attributable to buildout of the General Plan are shown on Figure 4.1. Future LOS at the study intersections with existing lane configurations is summarized in Table 4.3, and the ICU calculation worksheets are included in Appendix B. With this scenario, nine of the 29 study intersections are projected to operate at an unacceptable level of service in at least one peak hour.

5.0 PROPOSED MLUP

The Proposed MLUP includes additional residential units and commercial square footage in The Platinum Triangle compared to the adopted General Plan. The additional commercial square footage is distributed as shown below:

- 20,000 sq ft in the Katella District east of State College Boulevard
- 22,050 sq ft in the Gene Autry District south of Gene Autry Way
- 66,000 sq ft in the Katella District at Market Street
- 80,000 sq ft in the Gene Autry District at Market Street
- 22,050 sq ft in the Gene Autry District north of Gene Autry Way

Total planned development under the Proposed MLUP is shown in Table 5.1.

For this scenario, the traffic impact of proposed land use was analyzed for two conditions:

- Existing Lane Configurations; and
- Planned Circulation Improvements

The existing lane configurations at each of the study intersections are the same as summarized in Table 3.2. The planned circulation improvements for future mid-block and intersection lane geometry are shown in Figure 5.1 and Table 5.2.

Projected future daily trip generation in the study area for the Proposed MLUP is summarized in Table 5.3. Daily trip generation for the Proposed MLUP is projected to be approximately 270,000 daily trips, an increase of 10,000 trips (3.8 percent) over the Adopted MLUP.

Projected future daily traffic volumes with the Proposed MLUP are shown in Figure 5.2. The volumes are fairly consistent with the Adopted MLUP daily traffic forecasts; the largest differences are volume increases of 2,000-3,000 vehicles per day on Katella Avenue and State College Boulevard.

LOS at the study intersections for the Proposed MLUP under existing lane configurations is summarized in Table 5.4, and the ICU calculation worksheets are included in Appendix C. The table also shows the change in v/c compared to the Adopted MLUP land uses. With existing lane geometry, the same nine intersections operate at LOS E or F in at least one peak hour with the Proposed MLUP land uses. Of these, the following four represent significant adverse traffic impacts because the v/c increase is .02 or greater:

- Manchester I-5 SB at Katella
- State College at Orangewood
- Howell at Katella
- Sportstown at Katella

LOS at the study intersections for the Proposed MLUP under the planned circulation improvements is summarized in Table 5.5, and the ICU calculation worksheets are included in Appendix D. With the planned circulation improvements, all study intersections are projected to operate at LOS D or better in the AM peak hour, and all but one are projected to operate at LOS D or better in the PM peak hour. In many cases, the planned lane geometry is more than adequate to accommodate normal peak hour volumes. The additional lane capacity, in combination with the traffic management strategies implemented for events at the Angel Stadium of Anaheim and the Arrowhead Pond of Anaheim Pond, provide the ability for the street system to carry the additional peak hour traffic associated with an event at either venue.

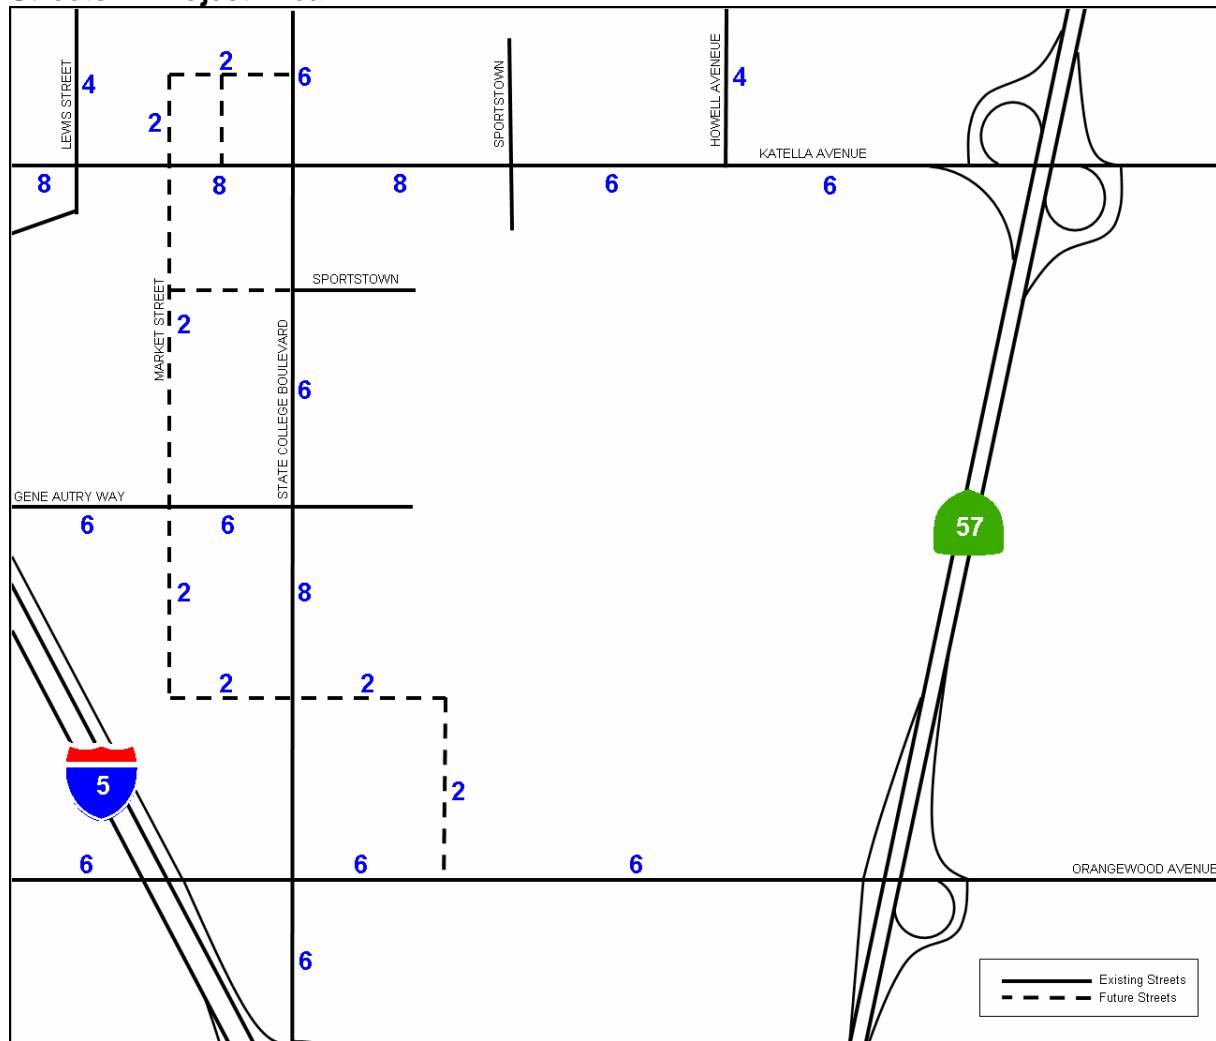

The intersection projected to operate at LOS E in the PM peak with the planned circulation improvements is Santiago at Meats. Since the v/c increase at Santiago at Meats is 0.01, the intersection would not experience a significant adverse traffic impact, so mitigation is not required.

6.0 MITIGATION MEASURES

Mitigation Monitoring Program No. 106 for The Platinum Triangle was adopted as part of the Stadium Area Master Land Use Plan Environmental Impact Report (EIR No. 321) and was further updated and modified to reflect the development intensities analyzed by the General Plan in association with Environmental Impact Report No. 330, prepared for the General Plan and Zoning Code Update approved by City Council in May 2004. There are a number of mitigation measures in the Updated and Modified Mitigation Monitoring Plan No. 106 for The Platinum Triangle intended to reduce impacts to transportation and circulation in the project area. As indicated in this study, no intersections are anticipated to experience significant traffic impacts with the planned circulation improvements as provided for in the General Plan, The Platinum Triangle Master Land Use Plan and associated documents and therefore no additional mitigation is required in addition to those measure indicated in Updated and Modified Mitigation Monitoring Plan No. 106 for The Platinum Triangle.
